# Survey of Major Load Balancing Algorithms in Distributed Systems

Igor N. Ivanisenko
Tamara A. Radivilova

# Contents

01. Introduction to Terms and Basics

02. Load Balancing Overview

03. Algorithm Types

04. Data Collection

05. Algorithms and Terms

# Introduction to Terms and Basics

# Load Balancing Definition

Load Balancing is the method of providing a uniform distribution of tasks between multiple network devices in a fashion that best meets functional and nonfunctional requirements.

# Load Balancing Overview

# Algorithm Overview
## Challenges and Goals

Challenges:
- Non-uniform processes and computing capacities requirements
- Non-uniform performance across nodes
- Non-uniform internode communication and bandwidths

Goals:
- Cost Effectiveness
- Scalability and Flexibility
- Priority

# Algorithm Types

# Algorithm Types

## System state, Initiation, Dynamic Balancing

System State:
- Static Algorithms
- Dynamic Algorithms

Initiation:
- Sender
- Receiver
- Symmetric

Dynamic:
- Centralized
- Distributed

# Data Collection

# Data Collection
## Three Types

Data Collection on Need

Periodic Collection

Change of State
